

## Core Skills Analysis

### Physics

- Understanding air pressure and its effects on objects, demonstrated through the process of pulling an egg into a bottle.
- Applying the concept of vacuum and how it allows the egg to be pulled in due to difference in pressure inside and outside the bottle.
- Learning about the impact of temperature on air pressure and how it influences the success of the experiment.
- Exploring the relationship between the size of the egg, the opening of the bottle, and the feasibility of the activity in terms of pressure dynamics.

### Chemistry

- Investigating the role of gas laws and how they relate to the changes in pressure during the experiment.
- Understanding the concept of gases expanding and contracting when subjected to varying pressures, as seen in the egg and bottle scenario.
- Observing the chemical properties of air and how they contribute to the experiment's outcome.
- Exploring the relationship between the composition of the air and its ability to create or withstand pressure changes.

### Tips

To further enhance the learning experience from the 'Pull an egg into a bottle' activity, students can experiment with different types of bottles, sizes of eggs, or even variations in temperature to observe how these factors impact the success of the experiment. Encouraging students to record and analyze their observations can deepen their understanding of the underlying scientific principles at play.
