Core Skills Analysis

Cognitive Development

- The 3-year-old student demonstrated improved problem-solving skills while customizing their avatar and navigating the virtual world in Roblox.
- Through building structures and vehicles in the game, the student showed creativity and spatial awareness.
- The activity promoted memory retention as the student remembered the steps to complete different tasks within Roblox.
- The student's attention span improved as they focused on completing game objectives and following instructions within the game.

Social Skills

- The student engaged in collaborative play, interacting with other players to achieve common goals within the Roblox game.
- Through teaming up with other players, the student learned cooperation and communication skills.
- The student showed empathy and understanding by helping other players in need during the gameplay.
- Role-playing within the game allowed the student to explore different social interactions and scenarios, enhancing their social awareness.

Tips

To further enhance cognitive development, encourage the 3-year-old student to narrate their gameplay experiences, fostering language skills. Providing opportunities for the child to create their own simple games within Roblox can boost their problem-solving abilities and creativity. Setting limits on screen time and balancing Roblox with physical play can promote healthy development.
