

## Core Skills Analysis

### Mathematics

- The student learned about cause and effect as they observed how toppling the first domino led to a chain reaction, illustrating basic principles of physics.
- They practiced counting and sequencing by organizing the dominos in a specific order before pushing them down.
- Through trial and error, the child learned about spatial reasoning and problem-solving skills as they adjusted the dominos to create different paths.
- By estimating the distances and angles between the dominos, the student unknowingly engaged in early geometry concepts.

### Tips

To further enhance the 4-year-old's learning through this activity, encourage them to create more complex domino setups with patterns or different shapes. Introduce the concept of speed and force by varying the power used to push the dominos. Additionally, incorporate basic math by asking the child to count the dominos or add up the total as they fall.
