

Activity: "Observing Flowers Under a Magnifying Glass"

Science

- The child learned about the different parts of a flower, such as petals, stamens, and pistils.
- They discovered how flowers reproduce through pollination.
- The child observed the intricate details of flower structures and learned about their functions.
- They gained an understanding of how magnification can enhance our ability to observe and study small objects.

Engage the child in further exploration by encouraging them to collect different types of flowers and examine them under the magnifying glass. They can document their findings by drawing detailed diagrams of the flower structures or writing descriptions of what they observe. Additionally, they can research and learn about different types of flowers and their unique characteristics.
