

## Math

- The child learned about counting by identifying and counting the number of wheels on different types of tractors.
- They practiced addition and subtraction by determining how many tractors were left after some were added or taken away from a group.
- They learned about measurements by comparing the sizes of different tractors and their parts.
- The child used patterns to identify the sequence of tractor colors in a row of tractors.

For continued development, encourage the child to explore more math concepts related to tractors. They can practice multiplication by determining the total number of wheels on a given number of tractors. They can also learn about geometry by identifying and drawing different shapes found on tractors, such as circles for wheels and rectangles for the tractor body. Additionally, they can measure and compare the distances tractors can travel, or the weights of different tractor models.
