

Activity: "Played with hotwheels and built track"

Science

- The child learned about friction and how different track surfaces impact the speed and movement of the hotwheels cars.
- They gained an understanding of gravity and how it affects the cars as they roll down inclined tracks.
- By experimenting with different track configurations, the child explored concepts of force and motion.
- They also observed the effects of potential and kinetic energy as the cars gained speed and then slowed down.

Encourage the child to take their hotwheels play to the next level by incorporating elements of engineering and design. They can try building more complex track systems with loops, jumps, and tunnels, challenging themselves to create structures that provide exciting and smooth rides for the cars. Additionally, they can explore concepts of aerodynamics by designing and testing cars with streamlined shapes to see how it affects their performance on the track.

Book Recommendations

- [Hot Wheels: The Ultimate Handbook](#) by Scholastic: This comprehensive guide provides information on a wide variety of hotwheels cars and tracks, offering fun facts and tips for creating epic race tracks.
- [The Science of Hot Wheels](#) by Ian Graham: This book delves into the science behind hotwheels, explaining concepts such as friction, energy, and motion through the lens of these popular toy cars.
- [Engineering Adventures with Hot Wheels](#) by Chris Oxlade: This book combines the excitement of hotwheels with engineering challenges, guiding children through the process of designing and building their own tracks and stunt courses.
