

## Math

- The child learned that a whole orange can be divided into equal parts called fractions.
- They understood that fractions represent a part of the whole orange, such as half or a quarter.
- They practiced identifying and naming fractions by looking at the orange slices.
- The child learned that different fractions can be combined to make a whole orange.

For continued development, you can encourage the child to explore fractions in other contexts. For example, they can cut other fruits or snacks into equal parts and discuss the fractions. You can also introduce fraction manipulatives, like fraction bars or circles, to help them visualize and understand fractions better.
