

## Math

- The child learned the concept of addition by physically combining two sets of objects.
- They practiced counting objects and then adding them together to find the total.
- The child learned to write number sentences to represent addition, such as  $2 + 3 = 5$ .
- They also learned the concept of the equals sign ( $=$ ) and how it represents that both sides of the equation are equal.

To continue developing addition skills, you can encourage the child to practice addition using everyday objects or even their fingers. They can also play games that involve addition, such as dice games or card games where they have to add up the numbers on the cards. Additionally, you can introduce them to online math games that focus on addition, which can make learning more interactive and fun.
