

Science

- The child has learned about teamwork and communication skills through playing Overwatch, as the game requires cooperation and coordination with teammates.
- They have also gained an understanding of physics concepts such as gravity and projectile motion, as these principles are applied in the game's mechanics.
- The child has developed problem-solving skills by analyzing situations and making strategic decisions in the game.
- Playing Overwatch has exposed the child to various technological aspects, such as the use of different weapons and abilities, which can spark an interest in computer science or engineering.

Continued development related to the activity could involve exploring the science behind game development, including topics like coding, game physics, and graphic design. Encourage the child to experiment with creating their own simple games using online resources or game development software. This can help foster their creativity and problem-solving skills further.
