

## Math

- The child has learned how to count objects by visually identifying and counting the cars in the parking lot.
- The child has practiced one-to-one correspondence by matching each car with a corresponding number as they count.
- The child has learned the concept of quantity and the association of numbers to represent the number of cars in the parking lot.
- The child has started to develop spatial awareness by observing the arrangement and positioning of the cars in the parking lot.

For continued development, encourage the child to explore different types of vehicles and their characteristics. They can categorize and count different types of vehicles they come across, such as trucks, motorcycles, or bicycles. Additionally, you can provide them with simple addition and subtraction activities using the number of cars in the parking lot as a context.

## Book Recommendations

- [Cars and Trucks and Things That Go](#) by Richard Scarry: This book introduces various vehicles and engages the child in counting and identifying different objects on each page.
- [Counting Cars](#) by Stuart J. Murphy: This book specifically focuses on counting cars and encourages the child to practice counting skills in a fun and interactive way.
- [The Little School Bus](#) by Carol Roth: This book tells the story of a little school bus and includes counting elements, allowing the child to practice counting while enjoying the narrative.
