

## Math

- The child learned how to plot data points correctly on a graph.
- They learned how to label the x and y-axis appropriately.
- The child learned how to connect the data points with a line to create the graph.
- They also learned how to interpret the graph and extract information from it.

For continued development, encourage the child to explore real-life scenarios where line graphs can be used, such as tracking daily temperature changes or recording sports scores over time. They can also create their own data sets and practice making line graphs from them. Additionally, introducing more complex concepts like slope and trend lines can challenge their understanding of line graphs further.
