

## Science

- The child has learned about the concept of gravity and its impact on the scooter's movement while riding up a hill.
- They have observed how the force of pushing the scooter propels it forward and helps it overcome the incline of the hill.
- The child has gained an understanding of balance and weight distribution as they navigate the scooter up the hill.
- They have learned about the importance of friction and how different surfaces affect the scooter's ability to climb the hill.

For continued development, encourage the child to experiment with different slopes and inclines to further explore the effects of gravity on the scooter's movement. They can also learn about different forces and how they come into play while riding a scooter.
