

Science

- The child learned about four major landforms: mountains, valleys, plateaus, and plains.
- They gained an understanding of the characteristics and features of each landform.
- They learned how these landforms are formed through natural processes such as erosion and tectonic activity.
- They developed their fine motor skills by molding and shaping the clay to represent the different landforms.

To further develop the child's understanding of landforms, you can encourage them to explore different types of landscapes around them, such as hills, canyons, or coastlines. They can also research how these landforms interact with the environment and affect human activities. Encourage them to create more detailed clay models or even use other materials like sand or paper mache to represent landforms. Additionally, you can introduce them to topographic maps and teach them how to interpret and read them to understand the elevation and shape of different landforms.

Book Recommendations

- [Geography from A to Z: A Picture Glossary](#) by Jack Knowlton: This book introduces children to various geographical terms, including landforms, through captivating illustrations and simple explanations.
- [Island: A Story of the Gal  pagos](#) by Jason Chin: This beautifully illustrated book tells the story of the Gal  pagos Islands, highlighting their unique landforms and the diverse wildlife that inhabits them.
- [A River Ran Wild: An Environmental History](#) by Lynne Cherry: This book explores the impact of human activities on a river and its surrounding landforms, emphasizing the importance of environmental conservation.
