Math

- The child has learned to understand the concept of probability and how to calculate the probability of simple events.
- They have grasped the concept of opposite events and how to determine the probability of opposite events.
- They can now analyze and predict the likelihood of different outcomes in simple events.
- The child has developed critical thinking skills by considering the probability of different outcomes in real-life scenarios.

For continued development, encourage the child to create their own simple probability games or challenges. They can design scenarios and calculate the probability of different outcomes. Incorporating real-life situations into these games can further enhance their understanding of simple events and opposite events. Additionally, discussing everyday situations where probability plays a role, such as weather forecasts or sports statistics, can help reinforce their understanding of the concept.
