

Science

- The first-grade child learned about the different body parts of a frog, such as the legs, eyes, and mouth.
- They learned about the life cycle of a frog, including the stages of egg, tadpole, froglet, and adult frog.
- The child gained an understanding of how frogs breathe and why they need to stay near water.
- They learned about the importance of frogs in the ecosystem and their role as both predator and prey.

For continued development, encourage the child to observe frogs in their natural habitat, if possible. They can also create a simple drawing or craft project related to frog anatomy, using different materials to represent the different body parts. Additionally, watching educational videos about frogs can provide further insight into their anatomy and behavior.
