

Alright, let's break it down! Imagine the internet is like a giant spider web that connects all the computers in the world together. Each computer is like a house, and the web is what allows them to communicate with each other.

When you want to visit a website, like playing a game or watching videos, you use a magical device called a computer or phone. This device sends a message, called a request, through the web to a special computer called a server, which holds the website's information.

The server then gathers all the information you need, like pictures and words, and sends it back to your device. It's like asking a librarian for a book, and they bring it to you! This happens super fast, so you can see the website on your screen almost instantly.

Behind the scenes, the web uses a special language called code to understand and send all the messages between computers. It's like speaking a secret language that only computers understand!

So, in a nutshell, the internet works like a huge spider web that lets us talk to each other and share all kinds of cool stuff, thanks to the magic of computers and servers.
