

I'm glad you're interested in learning about henna, a fun and interesting plant dye! Henna is a plant that grows in hot and dry climates, like India and parts of Africa. People have been using henna for thousands of years to decorate their bodies, especially their hands and feet. The leaves of the henna plant are crushed into a powder, mixed with water, and then turned into a paste. This paste can be used to make beautiful designs on the skin that last for a few weeks before fading away. Many people use henna to celebrate special occasions, like weddings, birthdays, and festivals. It's like painting temporary tattoos on your skin!
