

To find out how many zeros are in 1,000, we need to look at the different ways we can express the number.

First, let's start with the number 1,000. When we write this number out, we write it as 1,000. In this form, it's easy to see that there are 3 zeros, because there are 3 digits (0s) after the 1.

Another way to think about this is by looking at the place value of the digits in the number. In 1,000, the 1 is in the thousands place, which means there are three zeros following it. This is because each zero represents a power of 10. When we write numbers in standard form, like 1,000, the zeros tell us how many powers of 10 are being multiplied together. In this case, 1,000 is the same as $1 \times 10 \times 10 \times 10$, which is why there are 3 zeros.

So, no matter how you look at it, 1,000 has 3 zeros. Whether you count the number of digits or think about the place value and powers of 10, you will always come to the conclusion that there are 3 zeros in 1,000.

I hope that helps you understand how to find out how many zeros are in 1,000!
