Alright, let's break down how to divide 40 million by 1,000 in a way that's easy to understand. First, let's recall what division is. Division is the process of sharing or grouping a number into smaller parts.

So, when we divide 40 million by 1,000, we are essentially figuring out how many times 1,000 can fit into 40 million. To do this, we can start by taking the number 40,000,000 and visually grouping it into sets of 1,000.

Imagine a large box with 40 million individual items inside. If we want to divide these items into groups of 1,000, we can simply count out 1,000 items at a time until we've used up all 40 million. After counting, we find that we're able to create 40,000 groups of 1,000 items each, because 40,000 x 1,000 equals 40,000,000.

So, when we divide 40 million by 1,000, the answer is 40,000. In other words, if we have 40 million items and we put them into groups of 1,000, we end up with 40,000 such groups.

Remember, division is simply the act of dividing a quantity into equal parts, and in this case, we're dividing 40 million into groups of 1,000!
