

Hi there! When we say "snails' horns are eyes," it means that the little sticks or antennas on a snail's head have their eyes on the tips. These "horns" are also called "tentacles."

Here are some other easy ways to say it:

- The snail's eyes live on the ends of its little horns.
- A snail has tiny eyes at the top of its feelers.
- The horns on a snail's head are like its eye stalks.
- Snails use the tips of their horns to see the world around them.

So, snails don't have eyes just on their faces like we do — their eyes sit up high on their horns!
