

Hi there! Did you know that some monkeys have tails that work like another hand? That's right! Their tails are very special and strong. When a monkey wants to climb trees or grab onto branches, it doesn't just use its hands and feet—it can also use its tail to hold on tightly.

Imagine if you had one more hand to help you hold your toys or climb up the jungle gym. Monkeys use their tails in the same way. This kind of tail is called a "prehensile tail," which means it can grab things!

So, when a monkey swings from tree to tree, its tail helps it stay safe and balanced. Isn't that amazing? Monkeys have this cool tail to help them play and live in the trees.
