

Northern gannets are big, beautiful sea birds that live near the ocean. Instead of just floating on the water like some birds do, gannets like to soar high up in the sky above the waves. They use the wind to glide smoothly over the water, looking down for fish swimming below.

When a gannet sees a group of fish, it gets ready to catch them. The gannet doesn't just fly close to the water; it makes a big, fast dive straight down toward the fish. Imagine how cool it is to see a bird dive like a rocket into the water!

The gannet dives one after another, meaning many gannets take turns diving into the water quickly to catch as many fish as they can. They are very good hunters because their bodies are perfect for diving deep and swimming underwater to grab fish with their sharp beaks.

So, Northern gannets don't just float around—they soar high, spot their food, and dive fast to catch fish, making them amazing sea bird hunters!
