

Hello! Let's learn about how wasps make their nests.

Wasps are special insects that build their homes called nests. Here's how they do it, step by step:

1. **Find a Good Spot:** First, the wasp looks for a safe place to build its nest. This could be under tree leaves, inside bushes, or even under the roof of a house.
2. **Chew Wood:** The wasp uses its strong mouth to chew up bits of wood, like tiny sticks or old wood pieces.
3. **Make Paper Pulp:** After chewing the wood, the wasp turns it into thin, soft pulp that looks like paper.
4. **Build the Nest:** Using the paper pulp, the wasp starts to make layers, kind of like building a paper house. They stick the pulp together to make walls and little rooms inside.
5. **Make Cells:** Inside the nest, the wasp makes many small rooms called cells. These cells are where baby wasps grow!

So basically, wasps make their nests by chewing wood to make paper-like material and then building their little homes with it. Isn't that amazing?
