

Firefighters are heroes who help put out fires! They need water to do this. Here's how they get water:

1. **Fire Hydrants:** These are special water valves located on the streets. Firefighters connect their hoses to the hydrants to get lots of water quickly.
2. **Water Trucks:** Sometimes, firefighters use big trucks that have water tanks. They drive these trucks to the fire and spray water from them.
3. **Ponds and Rivers:** If there are no fire hydrants nearby, firefighters might use water from ponds, rivers, or lakes. They can use special pumps to suck up the water.
4. **Fire Stations:** Firefighters always have water ready at their stations in big tanks. They can fill their trucks with this water before rushing to help.

So, firefighters use different places to find water to help stop fires and keep everyone safe!
