

Hello! A submarine is a big, boat-like vehicle that can go under the water. Here are its parts:

- **Hull (body)** — The big, strong body that keeps water out.
- **Sail (top)** — The little tower on top where people look out.
- **Periscope** — A long eye that pops up to see above the water.
- **Propeller (back fan)** — The spinning fan at the back that pushes the submarine along.
- **Rudder and fins** — Tail pieces that help it turn and move up or down.
- **Ballast tanks** — Tanks that fill with water to sink and empty to float.
- **Hatch (door)** — The door where people get in and out.
- **Control room** — The place where people steer and watch the instruments.
- **Engine (motor)** — The thing that makes the submarine move.
- **Sonar (listening ear)** — Like an ear that listens under the water to know what is around.

That's it! A submarine is like a secret underwater house that can swim. Would you like a simple picture to look at next?
