

# Do All Excavators Have Wheels?

Hi there! Let's talk about excavators, which are big machines that help with building things like roads and houses.

## What is an Excavator?

An excavator is a big machine that can dig, move dirt, and lift heavy things. It has a long arm and a scoop on the end, which looks a bit like a big hand!

## Do They Have Wheels?

Now, about the wheels! Some excavators **do** have wheels, but many of them have tracks instead. Tracks are like the rubber things you see on toy tanks or some bulldozers. They help excavators move over different kinds of ground.

## Why Do Some Have Tracks Instead?

Tracks are great for balancing and moving over soft, muddy, or hilly places where wheels might get stuck. So, while some smaller excavators might roll on wheels, most large ones use tracks because they are more stable.

## Conclusion

So, in short, not all excavators have wheels! Some have tracks, and this helps them work better in tough places.

Isn't that cool? Excavators are really strong and can help build amazing things!
