

# What Train Drivers Do

Imagine you are playing with toy trains. When you push your train on the tracks, the train only goes where the tracks are laid out. Train drivers are like you, but they drive real trains on special tracks called routes!

## Special Routes

Just like roads for cars, trains have tracks they follow. These tracks go to different places, like cities or farms. The train drivers know the way because they have a map that shows these special train paths.

## Traffic Lights for Trains

When you are walking or riding your bike, you see traffic lights that help cars know when to stop or go. Trains have their own kind of traffic lights too! These special lights are called 'semaphore signals.'

## What is a Semaphore?

A semaphore is like a big arm on a pole that moves up and down or side to side. When the arm is up, it tells the train driver to stop, and when it is down, it means they can go. So, these signals help keep trains safe and make sure they are on time!

## Conclusion

So, train drivers follow their special routes and look at the semaphore signals to drive safely. They help the trains take people to fun places!
