

What is a Train Driver?

Just like you need a grown-up to drive a car, trains have a special person called a driver who helps them move. This driver is like the captain of the train!

How Does the Train Go?

The train driver helps the train follow its path, which is called a route. Think of it like following a map! The driver makes sure the train is going the right way, just like you would follow a path in a game.

What is a Semaphore?

As the train is moving, the driver looks for special signals called semaphores. These are like traffic lights for trains. If the semaphore is green, it means 'go!' If it's red, it means 'stop!' So, the driver is always watching to help keep everyone safe and make sure the train gets to where it needs to go.

Why is this Important?

The driver's job is super important because they help the train travel safely and on time. Just like how you need to listen to your parents when crossing the street, the train driver listens to the signals to keep everything running smoothly!
