

Okay, little buddy! Let's talk about trains! A train is a long vehicle that helps us travel or move things. Think of it like a big caterpillar! The front part of the train is called the engine, and it pulls behind it many smaller parts called carriages, which are like little rooms that carry people or things.

The train has shiny metal wheels that help it roll smoothly. But instead of driving on the regular road where cars go, trains run on special metal tracks called rails. These rails are straight and help the train go fast and safely.

Now, there are two main types of trains. Some trains are called passenger trains; they carry people like you and your family when you want to go to a different place, kind of like a giant bus that rides on tracks!

Other trains are called freight trains. These trains carry goods like food, toys, and lots of other things. So next time you see a train, remember it's either taking people to fun places or helping bring stuff to stores where we can buy them!
