

How Builders Know What to Do

When builders want to make a building, they need a very special guide. This guide is called a plan. It's like a treasure map but for making something big!

Step 1: Engineers Create the Plan

Engineers are like superhero thinkers! They sit down and think very carefully about how the building should look. They draw a picture that shows:

- The shape of the building (is it tall or wide?)
- Where the doors and windows should go (so people can get in and see outside!)
- What materials to use (like wood, bricks, or metal).

Step 2: Builders Follow the Plans

After the engineers make the plan, builders use it to know exactly what to do. It helps them build the building just right, instead of guesswork.

So, that's how builders know what to do! They follow the superhero plan made by engineers, and together they create amazing buildings!
