

What is an Excavator?

An excavator is a big machine that has a huge bucket on the front. Imagine a giant scoop that can dig deep into the ground!

What Does an Excavator Do?

Excavators are really good at digging. When people want to build things like houses or roads, they need to dig holes first, and that's where the excavator comes in. It can make big holes quickly and is very strong!

Where Do We Use Excavators?

We use excavators when we are:

- Building houses - They dig the foundation, which is like the house's strong base.
- Making roads - They help create paths for cars to drive on!
- Laying pipes - They dig trenches where pipes go to carry important things like water and gas to our homes!

Why are Excavators Important?

Excavators make it easier and faster to dig big holes than just using shovels. They help workers do their job better so we can have houses, roads, and the things we need delivered to us!
