

Digging is like making a big hole in the ground to help us build things! When we want to build a house or a road, we have to dig first. This is where tools come in to help us!

Imagine you have a shovel or a big machine called an excavator. A shovel is what you might use to dig in the dirt in your backyard. It helps you move dirt from one place to another and makes holes! An excavator is a big machine that can dig really big holes very quickly. It uses a big arm to scoop up lots of dirt!

When we make a house, we need to dig to lay down the foundation, which is like a strong base that keeps the house steady. And when we want to make a road, we also need to dig to prepare the ground so cars can drive smoothly.

So, tools help us with digging, and digging helps us build strong and safe places to live and travel!
