

Imagine you want to make a big hole in the ground or plant a tree. Sometimes, our hands just can't do the job because the dirt is too hard or too deep. That's where special tools come to help us!

These tools are called digging tools. Some of the most popular ones include:

- **Shovels:** These look like big, flat scoops. You use them to lift and move dirt or sand from one place to another.
- **Spades:** This is kind of like a shovel, but it has a sharper edge. You use it to cut into the hard ground.
- **Garden Trowels:** This little tool is like a small shovel. It's perfect for digging holes for flowers or small plants.
- **Pickaxes:** This tool helps break up really hard dirt or rocks. It has a strong pointy end for smashing things up.

So, digging tools help us by making it easier to break the dirt, move things around, and create holes. Without them, it would take a long time to do any digging!
