

Hey there! Did you know that there are special fish called electric rays? They live in the ocean and have a super cool trick. Just like how you can sometimes surprise your friends with a tickle or a funny joke, electric rays can surprise others with something called an electric shock!

Here's how it works: electric rays have special organs in their bodies that make electricity. Imagine if you could make your own lightning, wouldn't that be fun? When they feel like it, these rays can send a little zap of electricity to scare away other fish or to catch their dinner. But don't worry, their shocks are not mean like a scary monster — it's just their way of playing in the water!

So, the next time you think about electric rays, remember that they can give a little electric shock to keep themselves safe and find food, just like superheroes have special powers!
