

A banjo is a fun musical instrument that has a special shape. It has a round body, which means it looks like a circle. This round body is made of wood, which is a strong material that helps the sound be nice and loud.

On top of this round wooden body, there is a thin piece of material, usually called a drumhead, stretched tightly. This is like the skin of a drum, and it helps make music when you play the banjo. When you hit or pluck the strings of the banjo, the vibrations travel through the wooden body and out into the air, making beautiful sounds!

So, in short, a banjo's round body holds everything together and helps it produce music that we can enjoy!
