

An accordion is a special musical instrument that can make different sounds! It has **round buttons** that you can press with your fingers to play music. It also has **keys** that look like the ones on a piano, and when you press these keys, they make sounds too!

But what makes the accordion really interesting is the **bellows**. The bellows are like a big, soft bag that can be pulled apart and pushed together. When you pull the bellows apart, air goes through the instrument, and that's how we can hear music! So, when you play the accordion, you press the buttons or keys and move the bellows to create beautiful sounds!
