

Imagine you have a magical pipe called a flute. This flute makes beautiful music, but its sound can change! ☐

When you blow into the flute, it has different holes along its body. Each hole can be covered or uncovered, just like putting your finger on a water bottle! ☐

Here's how it works, step by step:

- **Blowing Air:** When you blow air into the flute, the sound starts funnelling through it, kind of like blowing through a straw!
- **Covering Holes:** The holes are like magic buttons! If you cover some of them with your fingers, the flute changes the sound it makes.
- **Different Notes:** When you cover a hole, it makes the flute shorter or longer on the inside. This makes different notes, like high sounds or low sounds! ☐
- **More Holes:** If you cover more holes, the sound will be lower, like a big drum. If you leave them open, it will be higher, like a tiny bell! ☐

So, playing the flute is like a fun game of hiding and showing the holes! Each time you play, you can make all kinds of amazing sounds! ☐
