

Okay! Imagine the flute is like a magic tube that can make different sounds. When you blow into the flute, it makes music. But here's the fun part: the flute has little holes on it. These holes are like doors that you can open or close with your fingers.

When you cover a hole with your finger, it changes how the air moves inside the flute. It's like if you have a bottle and cover the top, the sound is different than when the top is open. So, if you cover one hole, the sound is lower, and if you cover another hole, the sound can be higher!

Think of it like playing hide and seek with your fingers! The more holes you cover, the more different sounds you can make. And that's how the flute can play so many beautiful notes just by moving your fingers around!
