

Hi there, little one! Have you ever heard a big boom or a loud rumble when it rains? That's called thunder! Let's learn about it together, step by step.

1. ****What is Thunder?**** When the sky gets very stormy, it gets cold and hot at the same time. The air gets all mixed up, and that makes lightning happen. Thunder is the sound that comes from the lightning!
2. ****How Does Thunder Sound?**** Imagine you are playing with a big drum. When you hit the drum, it makes a loud sound. Thunder sounds much like that! Sometimes it's a loud bang like a drum, and other times it rumbles softly like a big giant's tummy!
3. ****Why Does Thunder Sound Different?**** Thunder can sound different because it travels through the clouds and the air. If it bounces around a lot, it can sound like a rumble. If it goes straight to us, it might sound like a big, loud clap!
4. ****Is Thunder Scary?**** Sometimes, thunder can be a little scary, especially if it's very loud. But remember, it's just a sound, and it means rain is coming to help the plants grow!

So the next time you hear thunder, you can think of it as a big drum playing in the sky. And that's how thunder sounds!
