

Okay, little buddy! Imagine a big, furry walrus on a cold, snowy ice patch. Walrus are super cool animals that live in very cold places. Sometimes, when they want to move around on the ice, they can't just walk like we do.

So, what do they do? They have these really long teeth called tusks! These tusks are like big, strong ice skates or tools. When the walrus wants to move, it uses its tusks to help pull and drag itself across the ice. It looks a bit like it's sliding or dragging a big toy!

This way, the walrus can get around without slipping and sliding too much. It's kind of like how you might use your hands to pull yourself along the floor when you don't want to walk! Isn't that clever?
