

Okay, so imagine if you were sending a letter to your friend. You write the letter, put it in an envelope, and then send it through the mail. The NBN is kind of like a super-fast, special post office for the internet. It helps all the internet stuff - like websites, movies, and games - travel really quickly from one place to another.

Just like the post office has different types of mail services, the NBN has different types of internet services. Some are like super-fast cars that get your internet stuff to your house really quickly, while others are like slow trucks that take longer. The NBN helps people and businesses choose the best internet speed for what they need.

For example, if you want to watch your favorite show on Netflix without any pauses or buffering, you need a fast NBN service. But if you're just sending emails or looking at pictures, a slower service might be okay. The NBN helps make sure everyone gets the right speed for what they want to do on the internet.

So, the NBN is like a super-fast internet delivery system that helps people and businesses get the right speed for their internet activities, just like how the post office helps deliver different types of mail. It's like having a special highway for the internet!
