

Imagine that you have a special machine called a concrete mixer. It's a bit like the mixer your mum uses in the kitchen to make cake batter. When she mixes flour, sugar, and eggs together, it's to make something yummy to eat.

But the concrete mixer does a different job. Instead of making food, it mixes **cement, sand, and water** together like your mum mixes ingredients. The mixer spins around, making sure all the parts are mixed really well.

When it's done mixing, we get **concrete**, which is a strong material used to build things like sidewalks, houses, and bridges. So, while your mum's mixer helps make treats for us, the concrete mixer helps make strong buildings!
