

What is an Excavator?

An excavator is a big machine that helps to dig holes and move heavy things. It has a big arm with a bucket at the end, just like a giant hand that can scoop up dirt, rocks, and sand!

What Do We Use Excavators For?

1. **Digging:** Excavators are used to dig holes in the ground. This can be for building a house or making a swimming pool.
2. **Moving Dirt:** They help move dirt and rocks from one place to another. Think of them as super strong helpers!
3. **Breaking Things:** Sometimes, excavators have a special tool at the end of their arm to break down big walls or old buildings.
4. **Flattening Land:** They can also make land flat so that it's ready for building something new.

Why Are Excavators Important?

Excavators make it easier and faster to get big jobs done. It's like having a robot do heavy work for us!
