

An excavator is a big machine that helps dig and move dirt, rocks, and other materials. It's like a giant toy scoop! Here are some things excavators are used for:

1. **Digging:** Excavators can dig deep holes in the ground. People use them to make space for foundations when building houses.
2. **Moving dirt:** They can scoop up dirt and move it to another place, just like how you might use a shovel in the sandbox.
3. **Demolishing:** Excavators can break down old buildings by swinging a big arm and smashing them, just like knocking down blocks.
4. **Creating ponds:** They can help to dig out areas for ponds or pools where kids can play.
5. **Landscaping:** Excavators help change the shape of land so it looks nice, like making hills or flattening areas.

So, an excavator is like a super helper in construction and landscaping. It's heavy and strong, making big jobs easier to do!
