

Okay, imagine you want to build a big Lego house! Before you start putting the blocks together, you need a plan. This plan is like a picture that shows where everything will go. It helps you know what to build first!

First, we need to make a strong base. This is like laying down a flat and sturdy piece of land where your house will sit. A strong base is super important because it helps the house stay steady, just like a strong table is good for holding your toys.

Next, we build walls. The walls are like the sides of our house that keep everything inside safe and cozy. You can think of the walls as tall blocks that go all around your Lego house!

Finally, we put on a roof. The roof is like a big hat that keeps the rain and snow out! It protects everything inside our house, making sure it stays warm and dry.

So remember, every house starts with a plan. Then, we make a strong base, build the walls, and add the roof on top! That's how we create a safe place to live!
