

Hey there! Your skin is brown because of a special thing called melanin. It's like the color inside a crayon that makes it red, blue, or brown. Everyone has melanin, but some people have more, making their skin darker, like a brown crayon. Think of it like baking cookies - some have more chocolate chips than others!

So, if your family is from a sunny place, like near the equator, your skin might have more melanin to help protect you from the sun. It's like wearing a natural sunscreen! But if your family is from a place with less sun, you might have less melanin and a lighter skin tone.

Just like how some flowers are different colors, people's skin can be different colors too. It's all because of the amazing melanin! And it's so cool that we all have this wonderful variety of skin colors.

Remember, no matter what color our skin is, we are all important and special. It's like having a big box of crayons - each one is unique and beautiful in its own way!

So, that's why your skin is brown - all thanks to the awesome melanin. Keep being curious and learning about the amazing world around us!
