

Hi there! Let's talk about how mechanics work on cars, like changing tires and filling them up with fuel! Imagine a car is like a big toy that helps us go to fun places.

1. **What is a mechanic?** A mechanic is a person who fixes cars. They know a lot about how cars work, just like how a doctor knows how to help us when we're sick!

2. **Changing the tyres:** Tyres are the round things that help the car roll on the road. Sometimes, they can get flat, like a balloon with no air. When that happens, the mechanic uses special tools that are very fast, like a superhero!

3. **How do they do it?** First, the mechanic lifts the car up with a big machine called a jack. Then, they take off the flat tire and put on a new one. They do this quickly because they practice a lot!

4. **Filling the car with fuel:** Cars need fuel, which is like food for them, to go. The mechanic can fill the car up with fuel very fast using a pump. It's like using a super big straw!

5. **Why fast?** Mechanics work quickly because they want to help people get back on the road and go on adventures! Just like when you want to go play at the park!

So remember! Mechanics are like helpers who make sure our cars are ready for fun, and they can change tires and fill them up super fast! Isn't that cool?
