

Okay! Imagine you have a garden hose at home. When you want to water plants, you can hold the hose and point it where you want. But sometimes, you want a little water and sometimes a lot, right? That's where the fire hose lance comes in!

A fire hose lance is like a special tool that helps firefighters control the water. It looks like a long stick with a nozzle at the end. The nozzle is important because it lets them decide how much water comes out. If they need a lot of water to put out a big fire, they can open it wide. But if they only need a little bit, like to spray a small area, they can make it smaller!

So, when a firefighter sprays water using the lance, they can control it just like you control how much water comes out of your garden hose. This helps them use just the right amount of water to stop the fire without wasting it. Isn't that cool?
