

Building walls with bricks is like putting together a big puzzle!

First, we start with a flat piece of land. Then, we take bricks, which are like little blocks made of clay, and we stack them one on top of the other. Each brick is strong and helps hold the wall up.

We also use something called 'mortar,' which is like special glue, to stick the bricks together. This keeps them from falling over. It's important to make sure the bricks fit together nicely, just like your toys when you build with them!

As we build higher, our wall gets stronger. When the wall is finished, it can protect us from rain and wind and keep us safe inside our homes. That's why building walls with bricks is so great!
