

The Life Cycle of an Apple Tree

Let's learn about how an apple tree grows! The life cycle of an apple tree has four important steps:

1. Seed

Everything starts with a little **seed**. An apple seed is like a tiny treasure! When we plant it in the soil and give it water and sunlight, it starts to grow.

2. Sprout

Next, the seed becomes a **sprout**. This is when a tiny green plant comes out of the seed. The sprout needs lots of sunshine and water to keep growing strong!

3. Young Apple Tree

After the sprout grows bigger, it becomes a **young apple tree**. It will have small branches and leaves. This tree is still learning how to grow apples and needs care from gardeners to stay healthy.

4. Adult Apple Tree

Finally, the tree grows up to be an **adult apple tree**. This is when it can make delicious apples! The tree will bloom pretty flowers first, and after a while, those flowers turn into apples.

The Cycle Starts Again

When the apples fall from the tree, they can grow new seeds, and the whole process starts all over again!

And that's how an apple tree grows! Isn't nature amazing?
